## Cafe Website

This project is a website for a cafe business. User can visit the site to find out more information about the cafe. The website is constructed with 5 unique pages.

### **LANDING PAGE**

The landing page shows that the cafe fills the need of the users desire for coffees, teas, and desserts. It also shows the currently popular drinks of each type. It also has box containers that can lead to other pages in the website. At the bottom, the box with the map shows the location of the cafe.

### **MENU PAGE**

The menu page shows all items available at the cafe.

The user can click the individual drink icon which will launch modal that will display more information on the item. The user can also click the heart toggle to save the drink for later.

## **ABOUT PAGE**

The about page shows the user how the cafe came to be, and it's core values.

## **CONTACT PAGE**

The contact page enables the user to reach out to the cafe business by sending the a message.

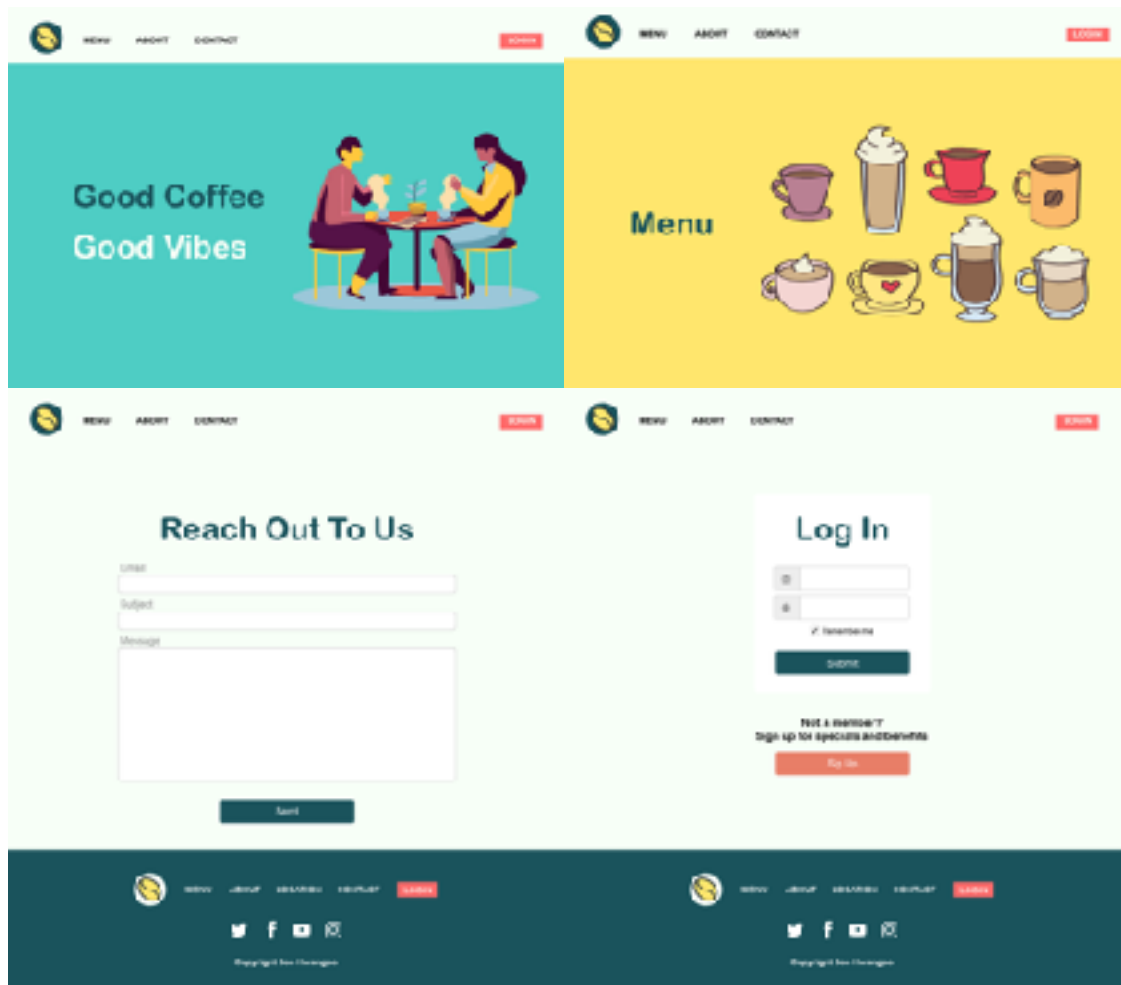

## **LOGIN PAGE**

The login page allows the user to login to the membership page by entering their email address and password. If the user is not a member, they can click the sign up button that will launch the modal with sign up form.

From the start, I wanted this website to have a very clean, modern design. Unlike most of the cafe websites where it uses photos to attract the user, I decided to use clean, flat vector icons throughout the site. This enables the websites to look very comfortable, and not “in your face” like other food service websites.

The code I used to make this website is: HTML, CSS, Javascript, and Material Design Bootstrap framework. The bootstrap allowed for easy responsive layouts, and it's components helped the website function well

with lesser code. Some of examples of the components I've used are the navbar, modal, and forms.

From This project, I have learned how to make a complete website using bootstrap components. I have also learned to make the designs in the pages more consistent using colors and typography. I believe that the best features of this website is its modern design, its clean interface, and straight forward user experience. I also gained from using bootstrap,

because it made my code cleaner, and more understandable. As I add on more function to the website, I would like to implement reusable components with React on the menu items, and also, make the login and sign up form function with backend.
